Errata:

- 1. The analysis of Pencil Pine forest (RPP) reservation presented in Attachment 1 has been identified as containing a significant error. These data have been excluded from analysis and have a very limited effect due to the forest ecosystem occurring overwhelmingly on land already in conservation reserves.**

1. Introduction

This report provides supplementary information to an analysis of scenarios of changes to the levels of reservation of forest ecosystems and old growth forests being considered for dedication as formal conservation reserves under the Tasmanian Forests Intergovernmental Agreement.

The analysis presented here should be read in conjunction with the previous reports on proposed changes to the Tasmanian forest reserve system ('comprehensiveness report', Knight 2012a¹) and on the progressive impact on reservation targets of scenarios for additional reserves ('scenario report', Knight, 2012b²). These reports contains more detailed information on the methods and data used, and on the composition of the original scenarios.

The previous 'scenarios report' assessed changes to the reservation levels of forest ecosystems and old growth forest of a progressive scenario of five additional increments to the reserved area using the following terms of reference:

"Consistent with IVG "Report 1A : Comprehensiveness", conduct an analysis of Tasmanian forest ecosystems and oldgrowth within the ENGO-proposed area on a progressive, incremental basis in the following sequence:

- (a) Enhanced Industry area (264,000 ha);
- (b) Special Timbers area (+ 57,000 ha);
- (c) WHA 2011 area [G Law via Envt. Tas. May 2011] (+ 61,000 ha);
- (d) WHA 2012 area [IVG via P Matthews] (+ 45,000 ha); and
- (e) Balance of ENGO-proposed area (+ 135,000 ha).

Provide a summary of any significant potential enhancement to meeting JANIS criteria as a consequence of each incremental step."

Subsequent to the 'scenarios report', instructions were issued for additional analysis incorporating a sixth scenario of 'JANIS-Tasveg Hotspots'. JANIS-Tasveg Hotspots were defined in the terms of reference as those parts of the IGA assessment area comprising:

- Threatened forest vegetation communities;
- Threatened non-forest vegetation communities; and
- Forests in the original five scenarios with less than 80% or their JANIS target met, up to and including the scenario at which 80% reservation is reached.

The latter group of forests is the subset of those identified in Table 7 of the scenarios report as currently having less than 80% of their reservation target met in existing reserves. Reference

to ‘JANIS targets’ in this document is to the bioregional analysis of forest conservation and reservation status presented in comprehensiveness report and subsequently broken down for the scenario report.

The JANIS-Tasveg Hotspots were subsequently refined spatially to produce a set of ‘Hotspots Reserves’ that were used to rerun the analysis for Tables 4 and 7 from the scenario report, to include as the first scenario the Hotspot Reserves to be followed by the other 5 scenario options.

2. Methods

The analysis was undertaken in four stages:

1. Spatially identify Hotspots meeting the critieria, using the data layer generated for the scenario report;
2. Delineation of appropriate management boundaries for the Hotspots to form the Hotspots Reserves;
3. Integrate the Hotspots Reserves into the scenario data layer; and
4. Rerun the scenarios with the addition of the Hotspots reserves to reconstruct Tables 4 and 7 from the scenario report.

Spatial identification of Hotspots

The data layer used to generate the original five scenarios (“T14_v714+OG+sc-1.shp”, see Section 2, Scenario report) was first attributed with an extra field to store data on the hotspot criteria applying to each polygon. Areas within the IGA assessed area where then queried and tagged in the following order:

- Threatened forest – forest communities listed under the Tasmanian Nature Conservation Act 2002 as Threatened;
- Threatened nonforest – nonforest vegetation communities listed under the Tasmanian Nature Conservation Act 2002 or Commonwealth Environment Protectiona and Biodiversity Cosnervation Act;
- EIA – Forest communities or old growth forest which reach 80% of their JANIS target under the Enhanced Industry Area scenario;
- STZ – Forest communities or old growth forest which reach 80% of their JANIS target with the addition of the Special Timbers area to the cumulative scenario;
- WHA2011 – Forest communities or old growth forest which reach 80% of their JANIS target with the addition of the World Heritage 2011 area to the cumulative scenario;
- WHA2012 – Forest communities or old growth forest which reach 80% of their JANIS target with the addition World Heritage 2012 area to the cumulative scenario;
- ENGO – Forest communities or old growth forest which reach 80% of their JANIS target with the addition of the balance of the IGA area to the cumulative scenario.

The set of areas meeting these criteria was copied to a separate GIS layer (“Hotspots_raw.shp”) for further work. This data layer contained the full set of data used for analysis of JANIS targets.

The polygons in this layer were subsequently dissolved to produce a new layer (“Hotspot_diss_raw.shp”) representing the contiguous extent of each area meeting the criteria. A unique identifier and area (hectares) calculate was added to each of the new polygons. This layer included contiguous areas both larger and smaller than the 5 hectare specification.

It was observed that some contiguous areas meeting the criteria were individually less than 5 hectares but occurred in relatively tight mosaics of other areas that also met the criteria. To help in the development of manageable boundaries for the hotspots a third layer was produced in which all the contiguous areas meeting the criteria were buffered by 25m and dissolved to form a new set of areas (“Hotspot_diss_buff25m.shp”).

Delineation of Hotspots Reserves

The GIS layers described in the preceding section were supplied to Forestry Tasmania for the purpose of delineating boundaries for Hotspots Reserves, based on a range of considerations for management.

Areas meeting the criteria as Hotspots that were within the EIA scenario area were not further refined. Additional areas were delineated for Hotspots Reserves that were outside the EIA scenario area. These were added to the original EIA area to produce a revised layer “EIAplus_290612.shp”.

For the purpose of further analysis the Hotspots Reserves were considered to be:

- The areas in the original EIS scenario that met the Hotspots criteria, due to management considerations having been considered in developing that element of the scenario; and
- The areas in EIAplus_290612.shp that were outside the original EIA scenario.

Integration of Hotspots Reserves into scenario analysis layer

The methods used to integrate the Hotspots Reserves into the GIS layer for further scenario analysis were driven largely by the relatively short timeframes of the project. The following work was undertaken to generate data for analysis:

1. An additional field was created in the original scenario layer for storing information on the revised scenarios arising from the hotspots analysis.
2. Areas with the original EIA scenario that met the Hotspots criteria were tagged as part of the Hotspots scenario.
3. The parts of the remaining four scenarios that intersected EIAplus_290612.shp were copied to a temporary GIS layer for further work.

4. A rapid geoprocessing method using mathematical calculations in a polygon->grid (10m)->polygon process was used to integrate the non-EIA areas of EIAplus_290612.shp with the extract of the original scenario polygons.
5. Logical consistency checks were performed on the integrated data to ensure data attributes were faithfully preserved in the integration process, and that changes in polygon areas arising through the method were within acceptable limits (small differences arise from the grid conversion process used).
6. These data were then merged with the unchanged polygons from the original scenario layer to produce a new layer for the analysis presented herein (“T14_v714+OG+sc+hot-1.shp”).
7. The unique identifier and area fields from the original scenario layer were copied to new fields and the Id and area fields updated to reflect the newly merged layer.
8. Areas that were added as Hotspots Reserves (i.e. outside the original EIA scenario but in the EIAplus area) were tagged as parts of the Hotspots scenario.
9. All untagged areas from the original scenario were added to the field for the revised scenario to complete the data for analysis.

Rerun scenarios

The same process used to analyse the original scenarios was used to analyse the revised scenarios. This involved creating, for each element of the scenario, a copy of the reservation analysis worksheet used for the comprehensiveness report.

The cumulative area within conservation reserves was then calculated for each part of the revised scenario sequence, and copied to the appropriate worksheet, viz:

- Current reserves;
- Current reserves + Hotspots Reserves;
- Current reserves + Hotspots Reserves + EIA;
- Current reserves + Hotspots Reserves + EIA + STZ;
- Current reserves + Hotspots Reserves + EIA + STZ + WHA2011;
- Current reserves + Hotspots Reserves + EIA + STZ + WHA2011 + WHA2012; and
- Current reserves + Hotspots Reserves + EIA + STZ + WHA2011 + WHA2012 + ENGO.

The cumulative areas of reservation in these worksheets, and the associated changes in reservation levels relative to targets were then used to reconstruct Tables 4 and 7 from the scenario report.

3. Results

The results of the analysis described above are presented in the following tables:

- Revised Table 1. Summary of broad vegetation types, JANIS reservation targets and CAR reserve status by revised IGA reservation scenarios;
- Revised Table 4. Cumulative summary of broad vegetation types, JANIS reservation targets and CAR reserve status by revised IGA forest reservation scenarios; and
- Revised Table 7. Under-reserved forest ecosystems and old growth types reaching JANIS reservation targets or increasing in reservation by more than 10% under revised IGA scenarios.

Revised Table 1. Summary of broad vegetation types, JANIS reservation targets and CAR reserve status by revised IGA reservation scenarios

⁶ It is important that figures in this table not be summed, as the figures integrate increases in old growth reservation with that for the matching forest ecosystem, i.e. any increase in old growth reservation is also included in the increase for the matching forest ecosystem.

4. Discussion

The introduction of the Hotspots Reserves to the scenarios results in a shift in the point at which significant enhancement of JANIS reservation targets is achieved. Table 1 shows the forest communities and old growth forests that are under-reserved and that increase by more than 5%, or reach their reservation target, by the point in the each set of scenarios at which this change occurs. This is identified by checking for differences of 5% or more between the same points in the two scenarios. For example, a significant changes is identified if the percent reservation to target in the revised EIS scenario is 5% or more larger than in the original scenario, or the reservation target has been met in the revised scenario but not in the original scenario. For some communities multiple points are identified. Forests for which the point of change moves to the Hotspots scenario from scenarios later than EIA are highlighted.

Table 1. Comparison of scenarios by point of change between scenarios of 5%, or reservation target reached, for under-reserved forest communities and old growth

This occurs principally through the transfer of threatened and under-reserved forest communities and old growth from the ENGO scenario (i.e. the balance of areas not included in the EIA, STZ or WHA scenarios) to the Hotspots scenario.

The table below illustrates this by indicating the source of areas in the revised scenarios from the five original scenarios.

Table 2. Composition of Hotspots Reserves scenario by origin

Original scenario	Hotspots Reserves scenario (ha)
EIA	13,153
STZ	68
WHA2011	3,103
WHA2012	5,493
ENGO	13,780

The overall changes in reservation of threatened vegetation communities and under-reserved forests are, however, on the whole relatively small. This arises in large due to the restriction of the IGA assessed areas to those nominated by ENGOs. As noted in the original scenario report, the lack of a systematic approach to identification of areas for inclusion in reserves, including through the lack of attention to the non-target elements of the JANIS criteria, may have negative consequences for biodiversity beyond any decision on reserves from the IGA.

This risk arises due to the bulk of the unprotected threatened vegetation and under-reserved forest on public land occurring outside the ENGO-nominated areas, and the overwhelming occurrence of these communities on private land. Table 3 shows the breakdown of vegetation categories assessed in this report by land tenure classes.

Table 3. Breakdown of broad forest and non-forest vegetation categories by land tenure

Vegetation type	Tenure category											Totals
	A1	A2	P2	A3	P3	FR	IR	PF	ZZ	PZ

Key to tenure categories:

A1 - Dedicated formal reserve;

A2 - Informal reserve on public land;

P2 - Informal reserve on public land proposed for reservation;

A3 - Other public land;

P3 - Other public land proposed for reservation;

IR - Indigenous protected area;

PI - Indigenous protected area proposed for reservation;

FR - Private conservation reserve

PF - Private conservation reserve proposed for reservation;

ZZ - Not attributed (freehold land plus any areas not attributed above); and

PZ - Unattributed areas proposed for reservation.

Attachment 1

Cumulative changes to forest ecosystem and old growth reservation by area and JANIS reservation targets of revised IGA scenarios

Key to column headings

Veg. code - Concatenated code combining the forest ecosystem code (left 3 letters) and “OG” for the old growth component, where applicable. For the bioregional summaries each concatenated code is suffixed by the IBRA code for the bioregion.

Extant (ha) - Mapped extant area of the forest ecosystem or the old growth component.

Pre-1750 (ha) - Estimated pre-1750 extent of the forest ecosystem. Old growth forests are a null value for this figure and indicated by “na”.

JANIS status - Conservation status codes for:

- Forest communities - p(C) not threatened, V Vulnerable, R Endangered, E Endangered;
- Old growth - p(OG) not Rare or Depleted, R/D Rare and/or Depleted.

Target (ha) - JANIS reservation target in hectares associated with the conservation status. Note that targets are adjusted to reflect a range of criteria described in Section 2 of Report 1A.

Current reserves (ha) - Current area of the forest ecosystem or old growth form in CAR reserves in Tasmania.

Hotspots (ha) – The area of the forest ecosystem or old growth included in the CAR reserve system if the Hotspots scenario were implemented.

EIA (ha) - The area of the forest ecosystem or old growth form that would be included in the CAR reserve system if the combined Hotspots and revised EIA scenario were implemented.

STZ (ha) - Area of forest ecosystem or old growth form included in the CAR reserve system if the combined Hotspots and revised EIA and STZ scenarios were implemented.

WHA1 (ha) - Area of the forest ecosystem or old growth included in the CAR reserve system if the combined revised EIA, STZ and WHA 2011 scenarios were implemented.

WHA2 (ha) - The area of the forest ecosystem or old growth form included in the CAR reserve system if the combined Hotspots and revised EIA, STZ, WHA 2011 and WHA 2012 scenarios were implemented.

ENGO (ha) - The area of the forest ecosystem or old growth form included in the CAR reserve system if the combined Hotspots and revised EIA, STZ, WHA 2011, WHA 2012 and ENGO scenarios (i.e. all of IGA assessed area) were implemented.

Hotspots (%), EIA (%), STZ (%), WHA1 (%), WHA2 (%), ENGO (%) – Percentage of the total IGA assessed area represented by the corresponding column of hectares.

Observation of forest ecosystems and old growth of revised IGA scenarios, Statewide assessment
